Nothing is live — the current site is untouched until you sign off.

WHAT CHANGED

Editorial instead of soft

The v1 site leaned warm and friendly. This one is ruled, high-contrast, and serif-led — closer to a technical journal than a SaaS landing page.

WHY

The claims are now specific

Every feature is listed as implemented, with the one unfinished item (store listing) called out. The layout has to carry evidence, not vibes.

WHERE

design/v2, unmerged

Lives in the repo, excluded from the Pages workflow. Promoting it is a one-line change once approved.

> **Read this deck as a proposal.** Three decisions at the end need your input; everything else is ready to ship as-is.

BEFORE / AFTER

Same content, different argument

Left is live today. Right is the proposal. The information is identical; the posture is not.

DIRECTION

Paper, ink, one red mark

A restrained palette where colour is a signal, not decoration. Vermillion marks the thing to look at; moss marks "done".

PALET

Warn stocl near- black ink

Crean paper rathe than white ink rathe than pure black Verm only for the eyebr the active mark, and the rule under each

S

M

TYPE

Serif displ sans body mono label

lowar for headi syste sans for reading, mono for metadata and keycaps. All system fonts — no webfont requests, no layout shift.

SECTION 1

The hero carries the status

Instead of a floating badge, the right column is a small ledger of facts: version, licence, host access, telemetry, sync.

- **Headline:** "Your windows, kept the way you left them." — the same promise, set in serif with one italic word.
- **Status card:** six facts a technical reader actually wants before installing. It replaces a vague "early developme pill.
- **One primary action:** install from source. The

secondary links to the repo, because there is no store listing yet.

- **Honesty:** the card says "not on the Chrome Web Store yet" rather than implying availability.

> This is the slide I expect you to have an opinion about: the status card makes the page read as unfinished by design. That is deliberate — the alternative is overclaimin

SECTION 2

The feature list becomes a ledger

Eleven rows, each a capability, a one-line description, and a status tag. Ten read "done"; one reads "next".

SECTION 3

Four surfaces, drawn once

A single diagram shows the same session list as a popup, a side panel, and a full tab — the clearest argument for the product in one image.

- **Inline SVG, not screens.** Stays sharp, themes with the page, and weighs about 4 KB.
- **One caption.** "One library. The same sessions, rendered for the space you have."

- **Keyboar hints** sit next to each surface, because that is how people actually reach them.

> The v1 site had a single large screens This version shows the relations between surfaces instead of one surface in isolation

SECTION 4

Privacy, stated as properties

Four claims, each one checkable in the manifest or the source. Then four numbers, because abstract promises are forgettable.

- **No hos per at ins** The exter cann read page
- **Histo and book optic** Requ only when used.
- **Sync is ciphe only.** Key never leave the devic
- **Expo is**

plain JSON
Read back, no lock-in.

> "No defa requ is the claim most wortl chec with sync off, the exter make no netw calls at all. That is asse in the sync E2E.

STORE PACK

What a submission still needs

The code is feature-complete for 1.0. What remains is packaging, and three items need decisions only you can make.

DECISION NEEDED

Three questions before this goes live

Answer these and I can promote the design, generate the store assets, and ship the listing.
